

To create a Notion template with 10 segments, here is a simple step-by-step approach:

Start a New Page: Create a new page in Notion where you want to build your template.

Add Blocks for Each Segment: For each of your 10 segments, add a block. These could be text blocks, headings, to-do lists, toggles, databases, or other content blocks depending on what your segments are about.

Create Columns for Layout (Optional):

If you want to arrange your segments side by side, you can create columns by dragging blocks next to each other horizontally.

Notion allows up to 5 columns in a row by default, but you can create multi-level columns by nesting column groups (e.g., 2 rows of 5 columns or combinations like 3 columns each having sub-columns).

This technique helps if you want to visually organize the segments in groups or sections.

Use Callout Blocks or Headings for Titles: Use callout blocks or heading styles to title each segment for clarity.

Turn the Page into a Template:

If part of a database, you can create a template inside your database to replicate this multi-segment page.

If it's a standalone page, you can duplicate the page anytime you want to reuse the template.

You can also create a "template button" inside the page which, when clicked, inserts predefined blocks or segments, helping you recreate the segments easily in other pages.

Save and Reuse: Once structured, duplicate the page or use the template button to create multiple pages with the same 10-segment layout.

This approach gives you flexibility in designing and organizing each of your 10 segments clearly in Notion, either as a single page template or within a database template for repeated use.

If you want, I can guide you on how to set up a template button or database template for this purpose. Let me know!
